

Reinforcing the 2nd generation Eurocode 7

DR ANDREW BOND (GEOCENTRIX)

CHAIR B/526 GEOTECHNICS

PAST-CHAIR TC250/SC7 GEOTECHNICAL DESIGN

Reinforcing the 2nd generation Eurocode 7

- ▶ What are the 2nd generation Eurocodes?
- ▶ What's in the new Eurocode 7?
- ▶ Does the new code cover reinforced fill structures?
- ▶ How does this affect existing UK practice?
- ▶ Summary of key points

What are the 2nd generation Eurocodes?

REINFORCING THE 2ND
GENERATION EUROCODE 7

Overview of the 2nd generation Eurocode suite

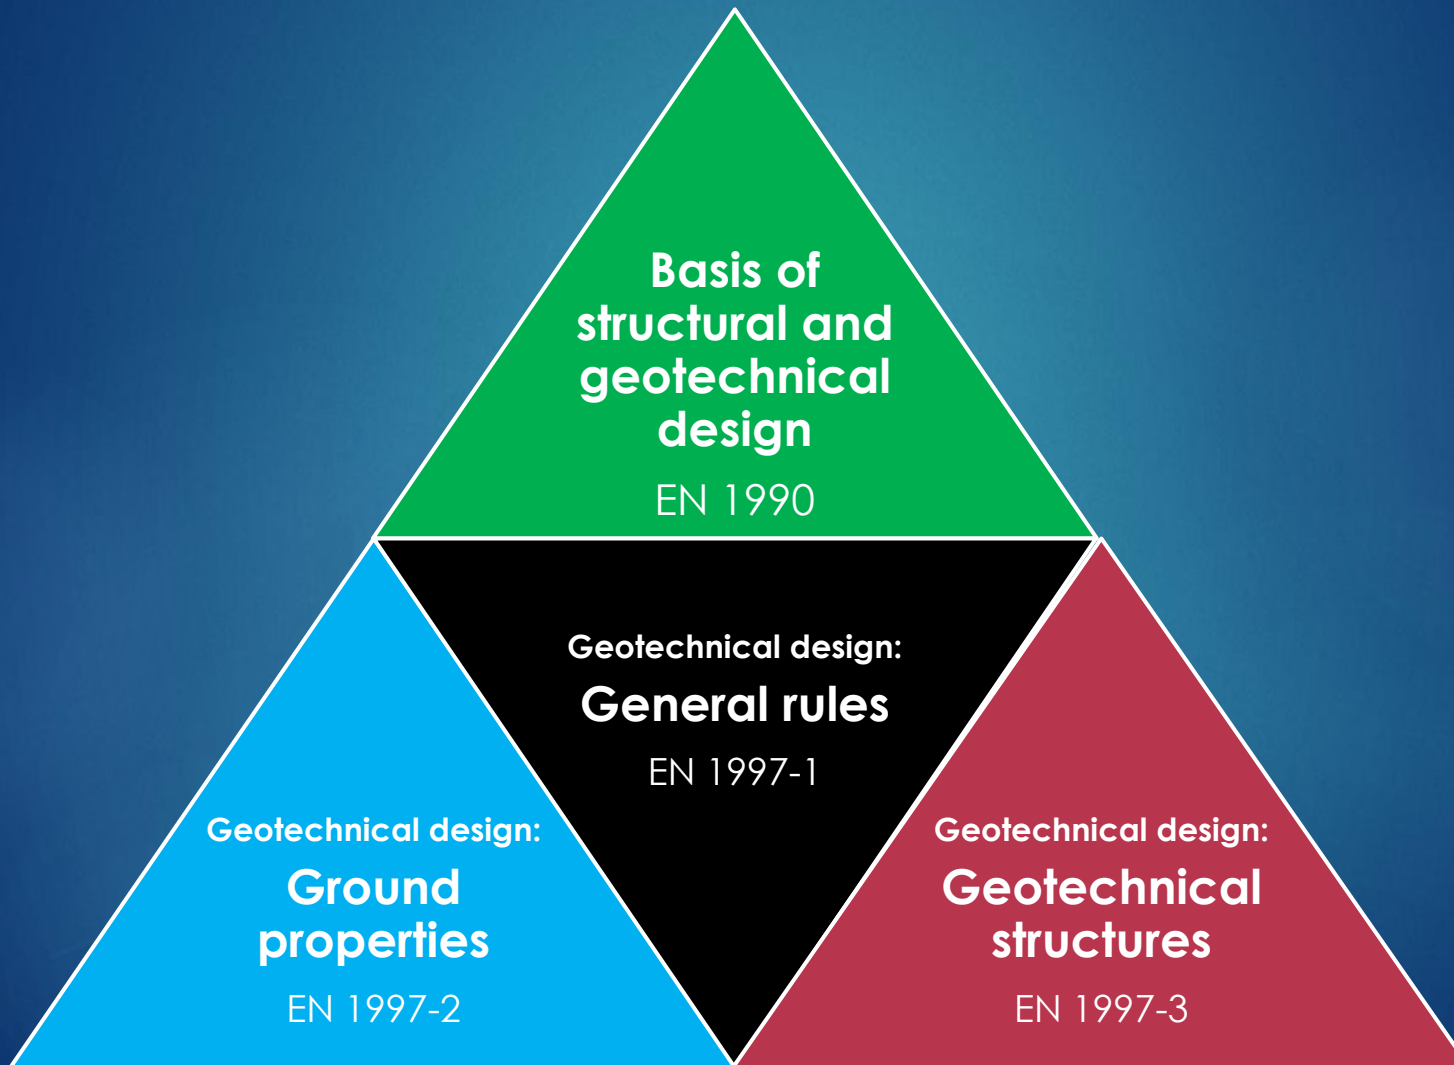

4

2nd generation Eurocodes

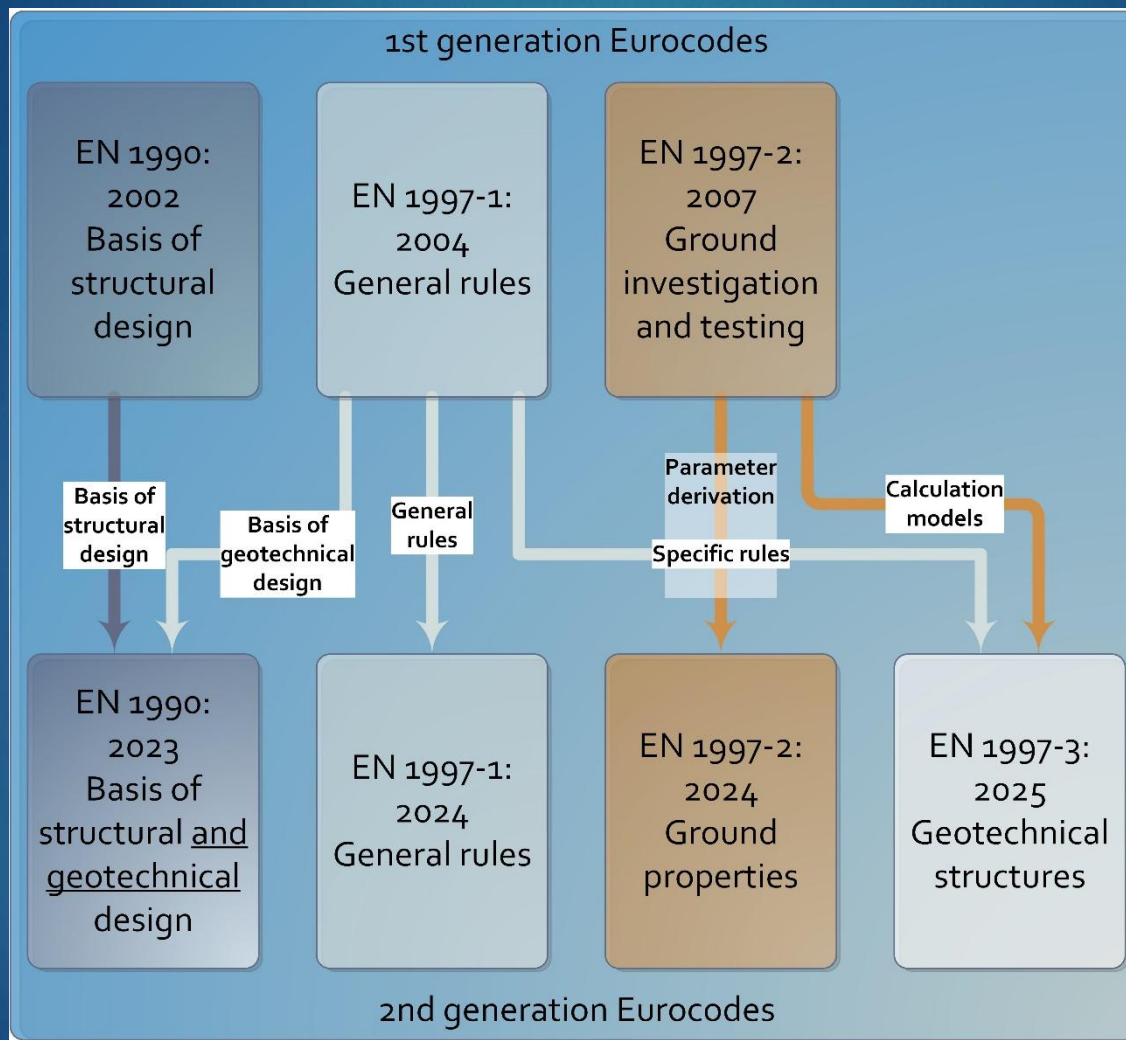

Core geotechnical design standards

5

2nd generation – transformation of Eurocode 7 into 3 Parts

6

What's in the new Eurocode 7?

REINFORCING THE 2ND
GENERATION EUROCODE 7

Assumptions made by EN 1997

In addition to the assumptions given in EN 1990, EN 1997 (all parts) assumes:

- ▶ **ground investigations** are planned by individuals or organizations **knowledgeable about potential ground and groundwater conditions** ← New
- ▶ ground investigations are executed by individuals with appropriate skill and experience
- ▶ evaluation of test results and derivation of ground properties from ground investigation are carried out by individuals with **appropriate geotechnical experience and qualifications** ← New
- ▶ data required for design are collected, recorded, and interpreted by appropriately qualified and experienced individuals
- ▶ geotechnical structures are designed and verified by individuals with **appropriate qualifications and experience in geotechnical design** ← New
- ▶ adequate continuity and communication exist between individuals involved in data-collection, design, verification and execution

Revised definition of the Geotechnical Category

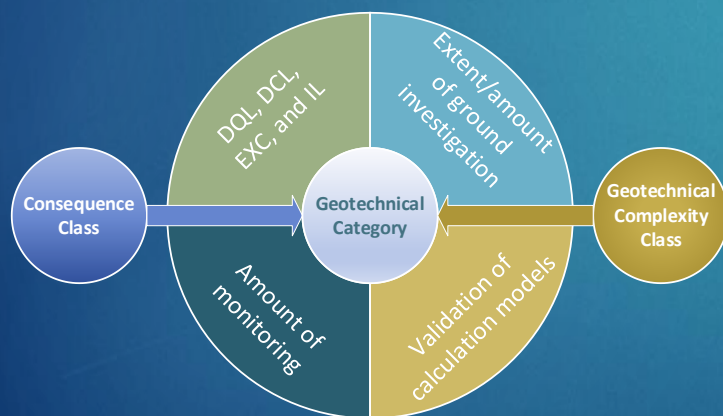

9

Decoding Eurocode 7 ©2005-25 Geocentrix Ltd. All rights reserved

Consequences of failure (CC)

Ground complexity (GCC)

Consequence Class	Geotechnical Complexity Class (GCC)		
	Lower (GCC1)	Normal (GCC2)	Higher (GCC3)
CC3			GC3
CC2		GC2	
CC1	GC1		

Sequences of failure

New

New

Consequence class/ Description		Loss of human life*	Economic, social or environmental*	Examples of buildings where...	Factor k_F	Reliability index, β_{50}	Probability of failure, $P_{f,50}$
CC4	Highest	Extreme	Huge	Additional provisions can be needed			
CC3	Higher	High	Very great	people assemble e.g. grandstands, concert halls	1.1	4.3	$\sim 10^{-5}$
CC2	Normal	Medium	Considerable	people normally enter e.g. residential and office buildings	1.0	3.8	$\sim 10^{-4}$
CC1	Lower	Low	Small	people do not normally enter e.g. agricultural buildings, storage buildings	0.9	3.3	$\sim 10^{-3}$
CC0	Lowest	Very low	Insignificant	Alternative provisions may be used			
*CC is chosen based on the more severe of these two columns							

Basic requirements of EN 1997-1

The following models shall be used to verify the requirements for safety, serviceability, robustness, and durability of geotechnical structures:

► **Ground Model**

► **Geotechnical Design Model**

Ground Model

- site specific outline of the disposition and character of the ground and groundwater based on results from ground investigations and other available data

Geotechnical Design Model

- conceptual representation of the site derived from the ground model for the verification of each appropriate design situation and limit state

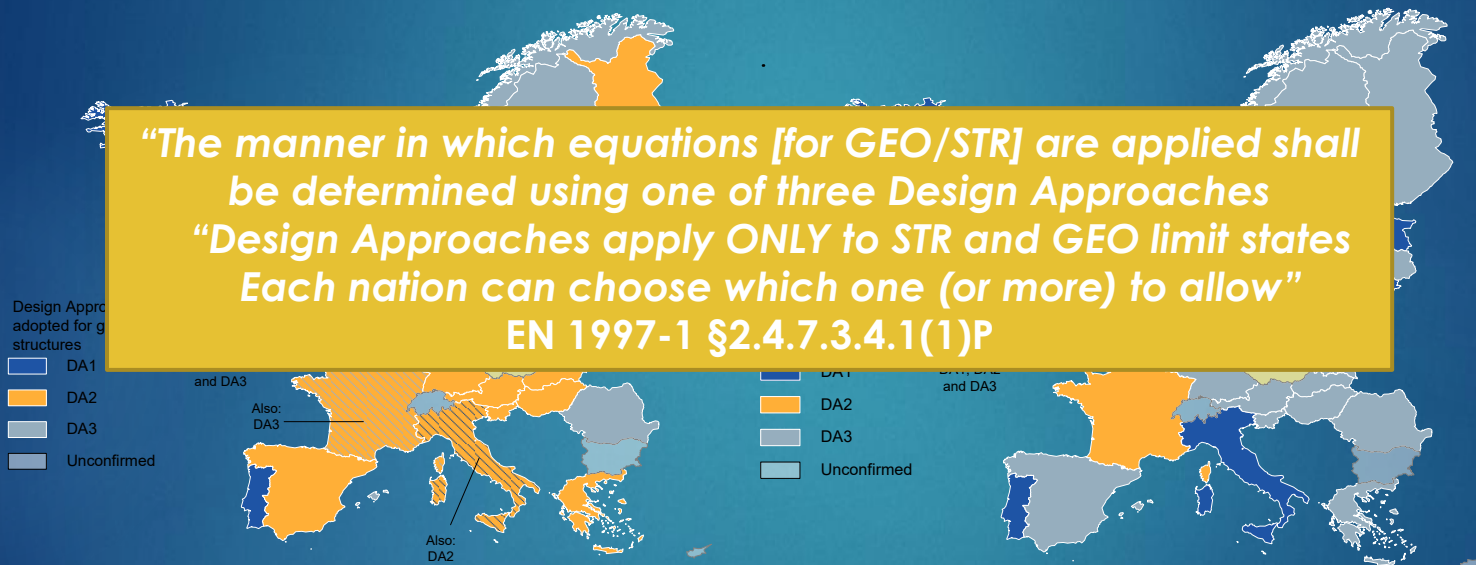

Limit states

The following ultimate limit states shall be verified, as relevant:	1 st -gen
failure of the structure or the ground, or any part of them including supports and foundations, by <ul style="list-style-type: none"> • rupture • excessive deformation • transformation into a mechanism • buckling 	STR/GEO 
loss of static equilibrium of the structure or any part of it	EQU
failure of the ground by hydraulic heave, internal erosion, or piping caused by excessive hydraulic gradient	HYD
failure caused by fatigue	FAT
failure caused by vibration	
failure caused by other time-dependent effects	

No single Design Approach – even in a country! (Bond and Harris, 2008)

13

Decoding Eurocode 7 ©2005-25 Geocentrix Ltd. All rights reserved

Verification of ultimate limit states

Ultimate limit states must be verified using:

$$E_d \leq R_d$$

For ultimate limit states caused by excessive deformation:

$$E_d \leq C_{d,ULS}$$

Factor may be applied to **actions**:

Verification Cases 1-3
(Factored actions)

Factors may be applied to **material properties**:

Material factor approach
(MFA)

or to **effects of actions**:

Verification Case 4
(Factored effects)

or to **resistance**:

Resistance factor approach
(RFA)

Partial factors for fundamental design situations (general application)

15

Action or effect				Partial factors γ_f and γ_E for Verification Cases 1-4							
Type	Group	Symbol	Resulting effect	Struct- ural*	Static equilibrium and uplift**		Geotechnical design				
				VC1	VC2(a)	VC2(b)	VC3	VC4			
Permanent action (G_k)	All	γ_G	unfavourable/ destabilizing	On actions				G_k is not factored			
	Water	$\gamma_{G,w}$									
	All	$\gamma_{G,stab}$	stabilizing								
	Water	$\gamma_{Gw,stab}$									
	(All)	$\gamma_{G,fav}$	favourable								
Prestressing (P_k)		γ_P						On effects			
Variable action (Q_k)	All	γ_Q	unfavourable								
	Water	γ_{Qw}									
	(All)	$\gamma_{Q,fav}$	favourable								
Effects-of-actions (E)		γ_E	unfavourable					γ_E is not applied			
		$\gamma_{E,fav}$	favourable								
*Also used for geotechnical design; **Less favourable outcome of (a) and (b) applies Values taken from EN 1990:2023, Annex A.1											

Partial factors for fundamental design situations (ground properties)

16

Ground property	Symbol	M1	M2
Soil			
Shear strength in effective stress analysis (τ_f)	$\gamma_{\tau f}$	1.0	1.25 k_M
Coefficient of peak friction ($\tan \phi'_p$)	$\gamma_{\tan \phi, p}$		
Peak effective cohesion (c'_p)	$\gamma_{c, p}$		
Coefficient of friction at critical state ($\tan \phi'_{cs}$)	$\gamma_{\tan \phi, cs}$		1.1 k_M
Coefficient of residual friction ($\tan \phi'_r$)	$\gamma_{\tan \phi, r}$		
Shear strength in total stress analysis (c_u)	γ_{cu}		1.4 k_M
Rock			
Unconfined compressive strength (q_u)	γ_{qu}	Same as γ_{cu}	
Shear strength of rock (τ_r)	$\gamma_{\tau r}$	1.0	1.25 k_M
Unconfined compressive strength of rock (q_u)	γ_{qu}		1.4 k_M
Discontinuities			
Shear strength of rock discontinuities (τ_{dis})	$\gamma_{\tau dis}$	1.0	1.25 k_M
Coefficient of residual friction ($\tan \phi'_{dis, r}$)	$\gamma_{\tan \phi, dis, r}$		1.1 k_M

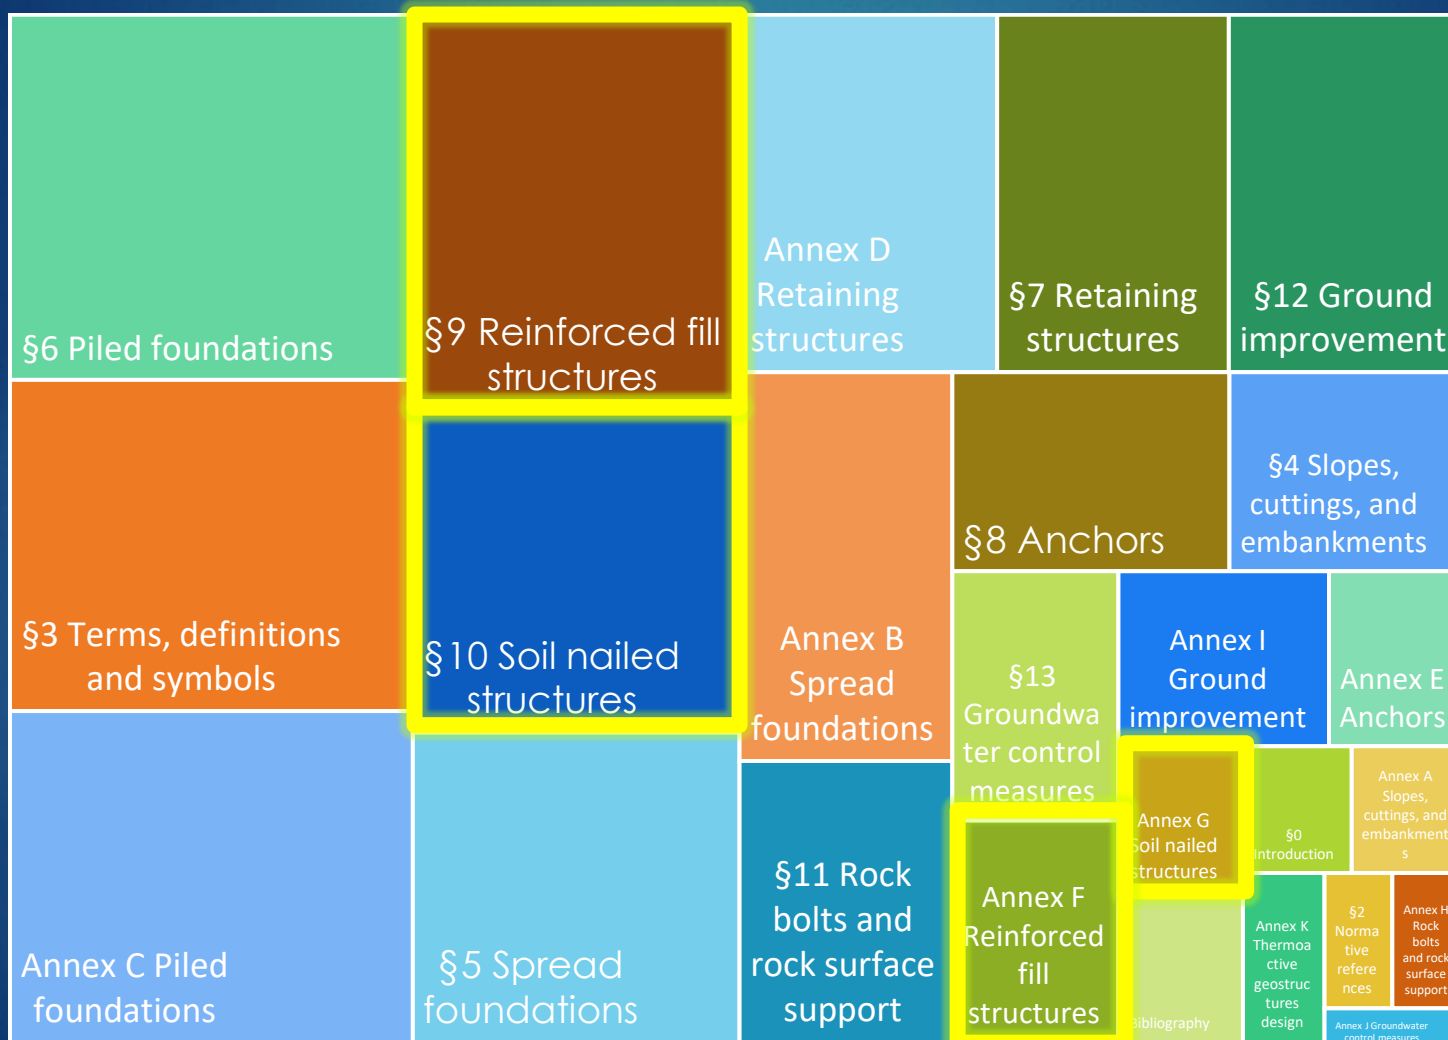

Does the new
code cover
reinforced fill
structures?

REINFORCING THE 2ND
GENERATION EUROCODE 7

Eurocode 7 – Geotechnical design – Part 3: Geotechnical structures

18

EN 1997-3 Geotechnical structures

Reinforced fill structures

19

Clause 9 applies to reinforced fill structures:

- ▶ reinforced walls and abutments
- ▶ reinforced slopes
- ▶ basal reinforcement for embankments (including load transfer platforms over inclusions and areas prone to development of voids)
- ▶ veneer reinforcement

Annex F provides complementary guidance to Clause 9 and covers:

- ▶ calculation models for reinforced fill structures

Reinforced fill structures illustrated

Basis of design clauses applicable to reinforced fill structures

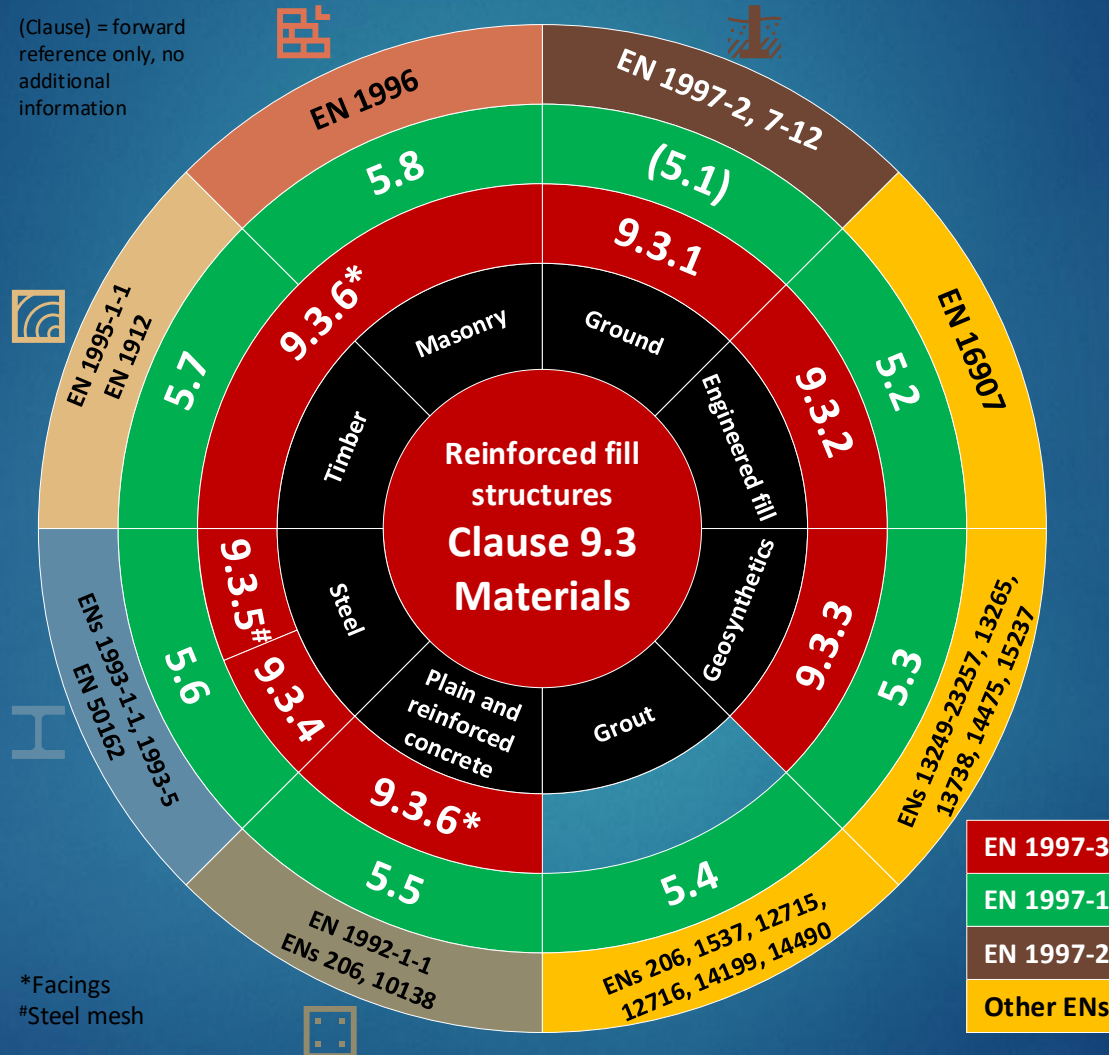

21

(Clause) = forward reference only, no additional information

Materials for reinforced fill structures

22

Tensile resistance of geosynthetic reinforcing elements

23

The representative **tensile resistance of a geosynthetic reinforcing element** is given by:

$$\overbrace{R_{t,el,rep}}^{\text{tensile resistance of element}} = \overbrace{\eta_{gs}}^{\text{reduction factor}} \times \overbrace{\hat{T}_k}^{\text{characteristic tensile strength}}$$

where:

$$\overbrace{\eta_{gs}}^{\text{reduction factor}} = \overbrace{\frac{\eta_{cr}}{1}}^{\text{creep}} \times \overbrace{\frac{\eta_{dmg}}{1}}^{\text{mechanical damage}} \times \overbrace{\frac{\eta_w}{1}}^{\text{weathering}} \times \overbrace{\frac{\eta_{ch}}{1}}^{\text{chemical and biological}} \times \overbrace{\frac{\eta_{cyn}}{A_5}}^{\text{fatigue}} \times \overbrace{\eta_{js}}^{\text{joints and seams}}$$

where the factors $F_{R,x}$ and A_5 are given in ISO TR 20432 and EBGE0, respectively

Guidance for geosynthetics ISO/TS 20432 and EBGEO

Decoding Eurocode 7 ©2005-25 Geocentrix Ltd. All rights reserved

Tensile resistance of wire mesh

The representative **tensile resistance of polymeric coated woven wire mesh reinforcement/wire mesh** is given by:

$$\overbrace{R_{t,el,rep}}^{\text{tensile resistance of element}} = \left(\overbrace{\eta_{pwm} | \eta_{wm}}^{\text{reduction factor}} \right) \times \overbrace{\hat{T}_k}^{\text{characteristic tensile strength}}$$

where:

$$\overbrace{\eta_{pwm} | \eta_{wm}}^{\text{reduction factor}} = \overbrace{\eta_{dmg}}^{\text{mechanical damage}} \times \overbrace{\eta_{cor}}^{\text{corrosion}}$$

where the sub-factors:

- ▶ (for reinforcing elements) can be determined according to EN 17738, *Geotextiles and geotextile-related products – Damage during installation procedure. Full scale test*
- ▶ (for facings to soil nailed structures) are 1.0 unless the National Annex or European Assessment Document give different values

Methods of analysing reinforced fill structures (1 of 2)

26

tie back wedge method

- ▶ method of analysis of reinforced soil structures that follows basic design principles currently employed for classical or anchored retaining walls

BS 8006-1, 6.3

coherent gravity method

- ▶ method of analysis based on the monitored behaviour of a large number of structures using inextensible reinforcements, corroborated by theoretical analysis

BS 8006-1, 6.3

Methods of analysing reinforced fill structures (2 of 2)

27

method of slices

- assumes that the interslice forces may be ignored because of the complexity of the reinforcement influencing these forces and because the presence of the reinforcement will mean that there is little distortion of the soil mass under consideration

BS 8006-1, 7.4.4.3

two-part wedge method

- assumes a bi-linear failure surface that has been shown to provide a reasonable representation of the potential failure surfaces for slopes. It is a logical extension of the Coulomb wedge approach for vertical wall

BS 8006-1, 7.4.4.2

Ultimate limit states for reinforced fill structures

28

Decoding Eurocode 7 ©2005-25 Geocentrix Ltd. All rights reserved

--- reinforcing element

Figure 9.2 — Examples of ultimate limit states for internal failure mechanisms for reinforced fill structures: (a) tensile failure, (b) pull-out of reinforcing elements, and (c) sliding along the interface between fill and reinforcing elements.

Key

--- reinforcing element

Figure 9.3 — Examples of ultimate limit states for reinforced fill structures involving internal failure mechanisms: (a) connection rupture, (b) shear failure between face elements (bulging), (c) shear failure between facing elements and reinforcing elements, (d) toppling of top facing elements not connected to reinforcing elements and (e) rotation of large facing elements connected to reinforcing elements at one elevation only

Values of partial factors for reinforced fill and soil nailed structures

29

Partial factor on	Symbol	MFA	RFA
Overall stability – See Clause 4, Slopes, cuttings, and embankments			
Bearing resistance and sliding – See Clause 5, Spread foundations			
Overturning – See Clause 7, Retaining structures			
Pull-out and direct shear			
Verification Case		VC3	<u>VC1</u>
Actions\$\$\$	γ_G	1.0	<u>1.35 k_F</u>
	γ_Q	1.3	<u>1.5 k_F</u>
Effects-of-actions\$\$\$	γ_E	x	x
Ground properties\$\$		<u>M2</u>	
	$\gamma_{\tan\phi}$ γ_{cu}	<u>1.25 k_M</u> <u>1.4 k_M</u>	x
Pull-out resistance\$	$\gamma_{R,po}$	x	<u>1.25</u>
Direct shear resistance\$**	$\gamma_{R,ds}$		

Values given for fundamental (persistent and transient) design situations
Underlined indicates primary source of reliability; (values = 1.0); x not factored
\$\$\$Values given in EN 1990, Annex A; \$\$EN 1997-1; \$EN 1997-3
▣ Options chosen in the UK National Annex; **Reinforced fill structures only

Values of additional partial factors for reinforced fill and soil nailed structures

30

Partial factor on tensile resistance of	Symbol	MFA and RFA
<i>Rupture of reinforcing element</i>		
Geosynthetic reinforcement	$\gamma_{M,gs}$	1.25
Structural steel to EN 10025	γ_{M0}	1.0*
Steel wires or ropes	γ_{M2}	1.25*
Reinforcing steel to EN 10080	γ_S	1.15**
Polymeric coated steel wire mesh reinforcement	$\gamma_{M,pwm}$ $\gamma_{M,wm}$	1.25
<i>Rupture of connections to facing or wire mesh</i>		
Reinforcing element	$\gamma_{R,con,el}$	As above
Connector	$\gamma_{R,con,c}$	1.25
Facing element	$\gamma_{R,con,f}$	from relevant EN
Connection to soil nail	$\gamma_{R,con}$	from EN 1993-1-1
Connection to adjacent wire mesh panels		1.25
Values given for fundamental (persistent and transient) design situations		
*From EN 1993-1-1:2022, **from EN 1992-1-1:2023		

Design tensile resistance of steel reinforcing elements

31

The design **tensile resistance** $R_{t,el,d}$ **of a steel reinforcing element** in a reinforced fill structure is given by:

$$\underbrace{\text{design tensile resistance of element}}_{\overline{R}_{t,el,d}} = \underbrace{\text{reduced area of element}}_{\overline{A}_r} \times \underbrace{\text{design yield strength}}_{\overline{f}_{yd}} = A_r \times \left\{ \begin{array}{l} \text{hot-rolled steel to EN 10025} \\ \begin{array}{c} \text{yield strength } \overline{f}_y / \text{partial factor } \overline{\gamma}_{M0} \\ \text{-- or --} \\ \text{proof strength } \overline{f}_{0.2k} \text{ at 0.2\% strain} / \text{partial factor } \overline{\gamma}_S \end{array} \\ \text{reinforcing steel to EN 10080} \end{array} \right.$$

Reduced cross-sectional area of steel reinforcement

32

Figure 9.4 — Loss of thickness due to corrosion resulting in reduced cross-sectional area

Key

- 1 Original section
- 2 Section after corrosion

The loss of thickness Δe is:

$$\Delta e = \overbrace{k_{cc}}^{\text{corrosion concentration factor}} \times \left(\overbrace{\tilde{A}}^{\text{loss of metal per face over first year}} \times \left(\overbrace{\tilde{T}}^{\text{design service life}} \right)^n - \overbrace{\tilde{e}_z}^{\text{thickness of initial zinc coating}} \right) \geq 0$$

Corrosion parameters for steel reinforcement in fill

33

Parameter		Steel	
		Galvanized	Non-galvanized
A (μm)	Land-based	25	
	Fresh water	40	
n	Land-based	0.65	0.80
	Fresh water	0.60	0.75

Parameter	Strip thickness [bar diameter] (mm)	Strength distribution	Steel	
			Galvanized	Non-galvanized
Corrosion concentr- ation factor, k_{cc}	4-6 [6-18]	Non-uniform/ unknown	2.0	3.0
		Uniform	1.7	2.5
	> 12 [> 40]	Any	1.0	1.0

The value of k_{cc} may be determined by testing, provided the test data is certified by a Technical Assessment Body and it is not less than that given for steel with a uniform strength distribution

37

Summary of key points

REINFORCING THE 2ND
GENERATION EUROCODE 7

Improvements in 2nd generation ...

EN 1997 *Geotechnical design*

39

- ▶ Organizational changes to Eurocode 7
 - ▶ Clearer layout aids ease-of-navigation
 - ▶ Greater consistency with EN 1990 aids ease-of-use
- ▶ No more Design Approaches!
 - ▶ Simpler choice of partial factors
 - ▶ Material Factor or Resistance Factor Approach
- ▶ Catering for different groundwater conditions
 - ▶ Better specification of groundwater pressures
- ▶ Separating consequence from hazard
 - ▶ Clear distinction between consequence of failure and complexity of the ground
 - ▶ Geotechnical Categories now drive meaningful decisions

Impact on the design of reinforced fill structures

40

Design rules for reinforced fill structures:

- ▶ are given in Clause 9 of EN 1997-3 (with additional guidance given in Annex F)
- ▶ supplement the general rules for geotechnical design given in EN 1997-1
- ▶ rely on rules for ground investigation given in EN 1997-2

EN 1997-3 Clause 9 is applicable to:

- ▶ reinforced walls and abutments
- ▶ reinforced slopes
- ▶ basal reinforcement for embankments (including load transfer platforms over inclusions and areas prone to development of voids)
- ▶ veneer reinforcement

EN1997-3 Clause 9 does not apply to:

- ▶ asphalt reinforcement of pavements
- ▶ geotextile encased columns (see Clause 11 instead)
